

Energy Storage Project Cost Structure

The lifecycle cost of an ESS are divided into four main categories: Upfront Owners Costs; Turnkey Installation Costs (energy storage system, grid integration equipment, and EPC); Operations and Maintenance Costs; and Decommissioning Costs [2]. DOE's Energy Storage Grand Challenge supports detailed cost and performance analysis for a variety of energy storage technologies to accelerate their development and deployment. The U.S. Department of Energy's (DOE) Energy Storage Grand Challenge is a comprehensive program that seeks to accelerate equipment accounts for the largest share of a battery energy storage system. Major components include the storage batteries, Battery Management System (BMS), Energy Management System (EMS), Power Conversion System (PCS), and various electrical devices. Among these, the battery itself typically makes up the largest share of the total cost. The annual Energy Storage Pricing Survey (ESPS) is designed to provide a reference system price to market participants, government officials, and financial industry participants for a variety of energy storage technologies at different power and energy ratings. Because of the impact of the myriad of technologies, the Department of Energy's (DOE) Energy Storage Grand Challenge (ESGC) is a comprehensive program to accelerate the development, commercialization, and utilization of next-generation energy storage technologies and sustain American global leadership in energy storage. The program is organized into several work areas. This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications. Cole, Wesley and Akash Karmakar. "Cost Projections for Utility-Scale Battery Storage: Update." Golden, CO: National Renewable Energy Laboratory. NREL/TP-6A40-85332. Energy storage technologies can provide a range of services to help integrate solar and wind, from storing electricity for use in evenings, to providing grid-stability services. Wider deployment and the commercialisation of new battery storage technologies has led to rapid cost reductions, notably in power station costs. This article takes a closer look at the construction cost structure of an energy storage system and the major elements that influence overall investment feasibility--providing DOE ESHB Chapter 25: Energy Storage System Pricing. The survey methodology breaks down the cost of an energy storage system into the following categories: storage module, balance of system, power conversion system, energy storage technology cost, and grid energy storage technology cost. The cost and performance assessment provides the levelized cost of storage (LCOS). The two metrics determine the average price that a unit of energy output would need to be sold at to cover all project costs inclusive of operations and maintenance. Cost Projections for Utility-Scale Battery Storage: In this work we describe the development of cost and performance projections for utility-scale lithium-ion battery systems, with a focus on 4-hour duration systems. The projections are based on DOE's Energy Storage Grand Challenge supports detailed cost and performance analysis for a variety of energy storage technologies to accelerate their development and deployment.
