Explore key strategies for implementing distributed storage for rural areas to enhance energy security. This article presents key strategies for implementing distributed storage systems in rural areas, emphasizing their critical role in enhancing local energy security and driving economic development. Rural electric cooperatives (co-ops) have a unique advantage in the clean energy transition. Their community-centered, non-profit model, and commitment to member service position them to lead the integration of distributed energy resources (DERs), such as rooftop solar, behind the meter battery storage. The Distributed Energy Production and Storage Technical Assistance Hub is a resource to support Community Lenders, project developers, businesses and communities develop and finance projects that deploy renewable power generation and storage technologies plus enabling infrastructure. Our goal is to address the challenges of intermittent resources. Intermittent resources are not dispatchable and can lead to grid challenges when their generation does not align with demand. Adding batteries and other storage technologies can help address these challenges by allowing a degree of dispatchability and providing a firm capacity asset for the grid. Energy storage will play an increasingly significant role in helping to meet New York's electric system needs. This includes peak load reduction, renewable firming and time shifting, carbon reduction, and increased resilience. To further New York's Clean Energy Standard requirements of 50% renewable energy closer to the customer, such as solar power, energy storage, and electric vehicles. Because of its reliability and low cost, energy efficiency can help scale up clean energy technologies as the market continues to develop.1 Coordinating energy efficiency and renewable energy resources can reduce peak demand. 4 Key Strategies for Distributed Storage for Rural Areas
