

Universal sine wave inverter

How you plan to use your pure sine wave inverter is one of the most important considerations in deciding what inverter to buy. First, does the inverter need to be portable - for example, for use on an RV or boat - or does it need to be hassle-free because it will be installed in a difficult to reach area as part of an off-grid home? Or if you are using it in a home, how much power will be available from your power inverter is one of its most important specifications, since this number determines what you can power and how many devices you can power at a single time.

Before choosing an inverter, take a look at the wattage requirements of the devices you plan to use. Inverters are typically rated in watts for both the amount of power they can continuously put out over periods of minutes to hours - known as continuous power - and the amount of extra power they can put out for a few seconds - known as surge power.

Continuous power dictates which and how many. Typically, sine wave inverters are designed to output the same voltage as standard electrical outlets in the country for which the inverter is marketed. That means in the US, sine wave inverters are designed to output 120 volts. The voltage, current, and wattage outputs of an inverter are related, such that for a fixed voltage a higher wattage will require more current. Buying a power inverter that has built-in overload protection is a good idea to protect both your inverter and the battery and devices you have plugged into it. Overload protection forces the inverter to automatically stop pulling power from the battery when the amount of current running through the inverter is greater than what the inverter is rated for.
