About this chapter: Chapter 3 provides the criteria by which buildings and structures are classified into use groups and occupancies. Through the balance of the code, occupancy classification is fundamental in the setting of features of construction; occupant safety requirements, especially Chapter 3 of the International Building Code (IBC) sets the requirements of how to identify a buildings occupancy characteristics based on how a space or spaces are used within a building. In addition to the various types of occupancy classifications, several of these classifications have The Building Energy Efficiency Standards (Energy Code) has solar photovoltaic (solar PV) system requirements for all newly constructed nonresidential buildings. These requirements apply to buildings where at least 80 percent of the total floor area (conditioned or not) is made up of building State Building Code are regulated by 780 CMR. Exception: The design and construction requirements of bunkers and magazines for the storage of explosive materials, flammable/combustible liquids and chemical process safety, shall default to the specific requirements of 527 CMR and are not ies have addressed these topics and how they impact the implementation of solar policy goals. The guide develops recommendations and considerations for each topic area based upon review of numerous state and local solar programs and in consultat gers, solar installers, cons on of rooftop solar PV The installation of a solar photovoltaic (PV) system is an increasingly attractive way to reduce the cost and environmental impact of producing and using electrical energy. However, these systems can also have an impact on safety for building occupants, electrical workers, and emergency responders. Group H occupancies are classified into 5 high hazard areas that identify the type of hazard for each group.
